CONFIGURAR SERVIDOR DNS 2

DAW Tarde EMILIO GARRUTA GONZÁLEZ

Contenido

Copiade Seguridad de la configuración anterior	2
Configurar servidor dns	3
Crear zona maestra	4
Creo la zona inversa	6
Comprobación funcionamiento dns	8
Ampliación	11
Restablecer configuración	14

Practica 2

Copiade Seguridad de la configuración anterior

Creo copia de seguridad de la configuración anterior.

```
daw-2t@ServidorLinuxegg:/etc/bind$ sudo tar -czvf /etc/bind_tarea31_backup.tar.gz -C /etc bind
[sudo] password for daw-2t:
bind/
bind/bind/ab.127
bind/named.conf.options
bind/db.empty
bind/db.255
bind/bind.keys
bind/named.conf.local
bind/zones.rfc1918
bind/db.local
bind/named.conf
bind/named.conf
bind/named.conf
bind/named.conf
bind/named.conf
bind/named.conf
bind/named.conf
bind/named.conf
bind/named.conf.default-zones
```

Aparece el archivo de backup en etc

```
2t@ServidorLinuxegg:/etc/bind$ ls /etc/
adduser.conf
                             environment.d
                                              locale.gen
                                                                  pam.conf
alternatives
                              ethertypes
                                              localtime
                                                                                 subgid
                                                                  pam.d
                                                                                 subgid-
                                                                  passwd
                                                                  passwd-
                             fstab
                                              login.defs
                                                                                 subuid
                                              logrotate.conf
                             fuse.conf
                                                                                 subuid-
apport
                                              logrotate.d
                                                                                sudo.conf

                                                                                ucf.conf
                             hosts
                                                                 rc3.d
ca-certificates.conf.dpkg-old hosts.allow
cloud.
                             hosts.deny
                                             modprobe.d
                                              modules
                                                                                update-manager
                              initramfs-tools modules-load.d
cron.daily
                             inputro
                                                                                update-motd.d
cron.hourly
                                                                  resolv.conf
                                                                                 update-notifier
                                              multipath.conf
```

Y borro las zonas creadas en la práctica anterior.

Se ve que ya no aparecen en la ventana de opciones global y el archivo de configuración local está vacío

Configurar servidor dns

Cambiamos la dirección ip Desde Red -> Configuración de red -> Interfaces de red

En interfaces editamos la dirección que tenemos

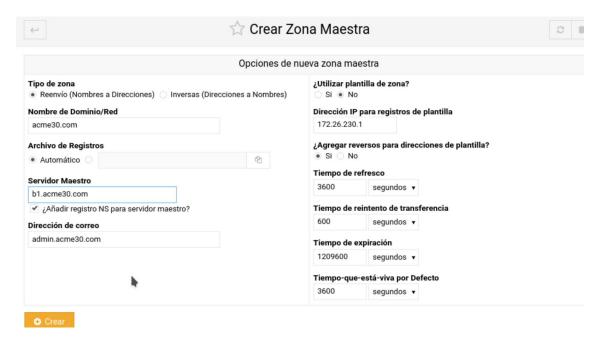

Y registramos la nueva ip, asignando la primera dirección libre de la red.

Crear zona maestra

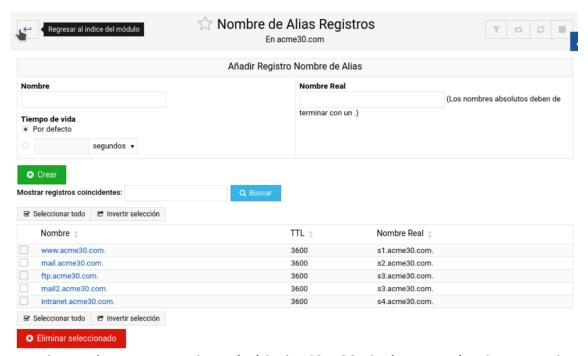

Creo la zona maestra

Creo las direcciones de registro

Creo los alias necesarios. No incluyo bl ya que el servidor será sl que alojará el servicio web es sl. Podría crear un alias descriptivo como dns pero no es necesario

creo los registros MX con las prioridades 10 y 20 el número más alto para el secundario

Verifico los registros antes de seguir

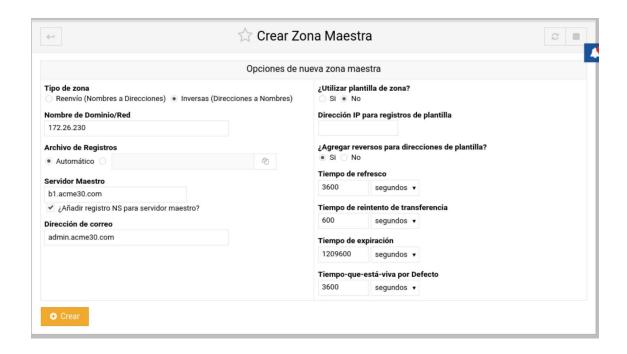

Así queda el archivo de registro

Este formulario le permite editar manualmente el archivo de registros DNS /var/lib/bind/acme30.com.hosts. Webmin

```
1 Sttl 3600
2 acme30.com. IN SOA b1.acme30.com. admin.acme30.com (
2025913114
3600
5 600
6 1209600
7 3600 )
8 acme30.com. IN NS b1.acme30.com.
b1.acme30.com. IN A 172.26.230.1
10 s1.acme30.com. IN A 172.26.230.11
12 s2.acme30.com. IN A 172.26.230.11
13 s4.acme30.com. IN A 172.26.230.13
14 www.acme30.com. IN A 172.26.230.13
15 mail.acme30.com. IN CNAME s1.acme30.com.
16 ftp.acme30.com. IN CNAME s3.acme30.com.
17 mail2.acme30.com. IN CNAME s3.acme30.com.
18 intranet.acme30.com. IN CNAME s4.acme30.com.
19 acme30.com. IN MX 10 mail.acme30.com.
20 acme30.com. IN MX 20 mail2.acme30.com.
```

Creo la zona inversa

Creo los PTRs

Así quedan los registros en la zona inversa

Y el archivo de registros

Este formulario le permite editar manualmente el archivo de registros DNS /var/lib/bind/172.26.230.rev. V

```
$ttl 3600
   230.26.172.in-addr.arpa.
                               IN SOA b1.acme30.com. admin.acme30.com (
               2025013105
               3600
               600
6
               1209600
               3600 )
8 230.26.172.in-addr.arpa.
                               IN NS b1.acme30.com

Ampliación

Se usan las ips (172.26.230.10 y 172.26.230.11) de s1 y s2 para el servicio web y el ftp respectivamente, para el servidor maestro de la zona, usaré el mismo que para acme30.com (b1.cohetesacme30.com 172.26.230.1)

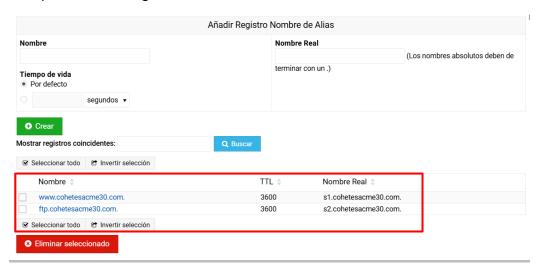

Creo la nueva zona maestra con nombre de dominio "cohetesacme30.com"

Creo los alias

Así queda la configuración de zona

Aplico los cambios

```
daw-2t@ServidorLinuxegg:~$ sudo service bind9 restart
[sudo] password for daw-2t:
daw-2t@ServidorLinuxegg:~$
```

Compruebo el funcionamiento

```
daw-2t@ServidorLinuxegg:~$ dig www.cohetesacme30.com
; <<>> DiG 9.18.30-0ubuntu0.22.04.2-Ubuntu <<>> www.cohetesacme30.com
